Database Performance Monitoring

We provide complete visibility into database performance for the entire engineering team at any scale without adding overhead to databases.

Troubleshoot and Diagnose Outages

With VividCortex, you can use time comparison to find potential causes of an outage after receiving an alert.

1. Profiler compares query workload against a previous time frame, when there was no outage.
2. UI shows any change in queries consumption, and lets you sort on the percentage change.
3. If there was no significant change, you may be able to rule out the database and focus elsewhere.
4. If there was a change... you can quickly identify outlier queries and drill into Explain plans.

See how VividCortex can help you troubleshoot potential outages.
